S.No: 10	Exp. Name: ***Write a Java program to implement Constructor overloading***	Date:2023-09-29

Aim:

Write a class `Box` which contains the data members **width**, **height** and **depth** all of type **double**.

Write the implementation for the below **3***overloaded constructors* in the class `Box` :

- **Box()** - default constructor which initializes all the members with **-1**
- **Box(length)** - parameterized constructor with one argument and initialize all the members with the value in **length**
  the members with the corresponding arguments
- **Box(width, height, depth)** - parameterized constructor with three arguments and initialize

Write a method `public double volume()` in the class `Box` to find out the **volume** of the given box.

Write the **main** method within the `Box` class and assume that it will receive either **zero** arguments, or **one** argument or **three** arguments.

For example, if the **main()** method is passed **zero** arguments then the program should print the output as:

```
Volume of Box() is : -1.0
```

Similarly, if the **main()** method is passed **one** argument : **2.34**, then the program should print the output as:

```
Volume of Box(2.34) is : 12.812903999999998
```

then the program should print the output as: Likewise, if the **main()** method is passed **three** arguments : **2.34, 3.45, 1.59**, then the program should print the output as:

```
Volume of Box(2.34, 3.45, 1.59) is : 12.836070000000001
```

Note: Please don't change the package name.

Source Code:

q11267/Box.java

```
package q11267;
class Box{
   double width,height,depth,volume;
   Box()
   {
      width=-1;
      height=-1;
      depth=-1;
   }
   Box(double w)
   {
      width=w;
      height=w;
      depth=w;
   }
   Box(double r,double b,double h)
   {
      width=r;
```

```
        height=b;
        depth=h;
    }
    public double volume()
    {
        volume=width*height*depth;
        return volume;
    }
    public static void main(String args[])
    {
        if(args.length==0)
        {
            Box b=new Box();
            System.out.println("Volume of Box() is : "+b.volume());

        }
        if(args.length==1)
        {
            double w=Double.valueOf(args[0]);
            Box be =new Box(w);
            System.out.println("Volume of Box("+w+") is : "+be.volume());
        }
        if(args.length==3)
        {
            double r=Double.valueOf(args[0]);
            double b=Double.valueOf(args[1]);
            double h=Double.valueOf(args[2]);
            Box be =new Box(r,b,h);
            System.out.println("Volume of Box("+r+", "+b+", "+h+") is : "+be.volume());

        }
    }
}
```

Execution Results - All test cases have succeeded!

Test Case - 1
User Output
Volume of Box() is : -1.0

Test Case - 2
User Output
Volume of Box(3.0) is : 27.0

Test Case - 3
User Output
Volume of Box(2.3, 3.5, 6.5) is : 52.324999999999996
